ExampleRelay · Claude Sonnet X audit · Internal decision card

2026-01-15 • internal only • external report: artifacts/ExampleRelay-Claude-audit-report.pdf

backup

Fictional example: the backend is real Claude on AWS Bedrock (not the first-party API), with no injection and no model swap; invalid params are swallowed into 200, and the price is official × 1.2.

Real model, no injection, but swallows params and costs more than the existing line.

Compared with existing lines for this model

Line	Cost	30-day success	30-day volume	Note
ExampleRelay tested now	1.2×	not connected	—	multiple of official list price
line-a VendorA	1.1×	99.2%	1.2M	primary

snapshot 2026-01-15 (fictional)

Claimed vs measured

Mismatch	Channel	AWS Bedrock (`msg_bdrk` prefix)
Match	Model	claude-sonnet-x (tokens match one by one)

Gateway: Supplier must fix

- Works without code changes **Native Anthropic /v1/messages**: official path and envelope
- **Invalid params swallowed**: vendor must pass 400 through

Ask business / supplier

- RMB top-up rate
- can they fix param passthrough

Risks

- Bedrock lacks some beta features

Next steps

- retest swallowed params after the fix
